

Pressure reducing valve, pilot-operated

Type DR

- ▶ Size 10 ... 32
- ▶ Component series 5X
- ▶ Maximum operating pressure 350 bar
- ▶ Maximum flow 400 l/min

Features

- ▶ For subplate mounting
- ▶ Porting pattern according to ISO 5781
- ▶ For threaded connection
- ▶ As cartridge valve
- ▶ 4 adjustment types, optionally:
 - Rotary knob
 - Sleeve with hexagon and protective cap
 - Lockable rotary knob with scale
 - Rotary knob with scale
- ▶ 5 pressure ratings
- ▶ Check valve, optional (only subplate mounting)
- ▶ Corrosion-protected design

	Size 32	✓	✓ (G1 1/2)	30
04	As cartridge valve (version "C", without main spool insert)			no code
	As cartridge valve (version "C30", with main spool insert)			–
	For subplate mounting			–
	For threaded connection			G

Adjustment type

05	Rotary knob	4
	Sleeve with hexagon and protective cap ("J3" version without protective cap; always with maximum pressure adjustment)	5
	Lockable rotary knob with scale	6 ²⁾
	Rotary knob with scale	7
06	Component series 50 ... 59 (50 ... 59: unchanged installation and connection dimensions)	5X

Set pressure

07	Up to 50 bar	50
	Up to 100 bar	100
	Up to 200 bar	200
	Up to 315 bar	315
	Up to 350 bar (only version "M")	350

Pilot oil supply

08	Internal pilot oil supply, external pilot oil return	Y
09	With check valve (for subplate mounting only)	no code ¹⁾
	Without check valve	M

Corrosion resistance

10	None	no code
	Improved corrosion protection (240 h salt spray test according to EN ISO 9227); (only version "5")	J3

Seal material (observe compatibility of seals with hydraulic fluid used, see page 5)

11	NBR seals	no code
	FKM seals	V
12	Further details in the plain text	

¹⁾ Not for version "J3"

²⁾ H-key with material no. **R900008158** is included in the scope of delivery.

Notes:

- For valve types for use in potentially explosive areas, refer to data sheet 07011.
- Preferred types and standard units are contained in the EPS (standard price list).

Without check valve "M"

With check valve "no code"

Function, section

Pressure valves of type DR are pilot-operated pressure reducing valves controlled from the secondary circuit. The pressure reducing valves basically consist of the main valve (1) with main spool insert (3) and pilot control valve (2) with adjustment type.

In the rest position the valves are open. Hydraulic fluid flows from channel B via the main spool insert (3) to channel A without restrictions until a pressure builds up in channel A which exceeds the value set at the spring (11) and opens the ball (6). The control spool (13) moves into closing direction. The desired reduced pressure is achieved when there is a state of equilibrium between the pressure in channel A and the pressure set at the spring (11). The pilot oil return from the spring chamber (14) is always realized externally via the control line (15) into the tank. For the free flow back from channel A to channel B, a check valve (16) can optionally be installed. A pressure gauge connection (17) allows for the control of the reduced pressure in channel A.

the channel (5) and in the spring chamber (12) holding the control spool (13) in the opened position. The hydraulic fluid in channel B can flow via the main spool insert (3) to channel A without restrictions until a pressure builds up in channel A which exceeds the value set at the spring (11) and opens the ball (6). The control spool (13) moves into closing direction.

The desired reduced pressure is achieved when there is a state of equilibrium between the pressure in channel A and the pressure set at the spring (11). The pilot oil return from the spring chamber (14) is always realized externally via the control line (15) into the tank. For the free flow back from channel A to channel B, a check valve (16) can optionally be installed. A pressure gauge connection (17) allows for the control of the reduced pressure in channel A.

Hydraulic fluid temperature range		°C	–30 ... +80 (NBR seals) –20 ... +80 (FKM seals)				
Viscosity range		mm²/s	10 ... 800				
Maximum admissible degree of contamination of the hydraulic fluid, cleanliness class according to ISO 4406 (c)			Class 20/18/15 ²⁾				

¹⁾ Only version "M"

²⁾ The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and simultaneously increases the life cycle of the components.
For the selection of filters, see www.boschrexroth.com/filter.

Technical data

(For applications outside the stated values, please ask us!)

Hydraulic fluid	Classification	Suitable sealing materials	Standards	Data sheet
Mineral oils	HL, HLP, HLPD, HVLP, HVLDP	NBR, FKM	DIN 51524	90220
Bio-degradable	► Insoluble in water	HETG	ISO 15380	90221
		HEES		
	► Soluble in water	HEPG	ISO 15380	
Flame-resistant	► Water-free	HFDU (glycol base)	ISO 12922	90222
		HFDU (ester base)		
		HFDR		
	► Containing water	HFC (Fuchs: Hydrotherm 46M, Fuchs Renosafe 500; Petrofer: Ultra Safe 620; Houghton: Safe 620; Union: Carbide HP5046)	ISO 12922	90223

Important information on hydraulic fluids:

- For further information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us.
- There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.).
- The ignition temperature of the hydraulic fluid used must be 50 K higher than the maximum surface temperature.
- **Bio-degradable and flame-resistant – containing water:** If components with galvanic zinc coating (e.g. version "J3" or "J5") or parts containing zinc are used, small amounts of dissolved zinc may get into the hydraulic system and cause accelerated aging of the hydraulic fluid. Zinc soap may form as a chemical reaction product, which may clog filters, nozzles and solenoid valves - particularly in connection with local heat input.

► Flame-resistant – containing water:

Due to increased cavitation tendency with HFC hydraulic fluids, the life cycle of the component may be reduced by up to 30% as compared to the use with mineral oil HLP. In order to reduce the cavitation effect, it is recommended - if possible specific to the installation - to back up the return flow pressure in ports T to approx. 20% of the pressure differential at the component.

Characteristic curves

(measured with HLP46, $\vartheta_{oil} = 40 \pm 5 \text{ }^{\circ}\text{C}$)

Notes:

- ▶ The characteristic curves apply to the pressure at the valve output $p = 0$ bar across the entire flow range.
- ▶ Valve body and hydraulic fluid temperature-compensated; large temperature differences may lead to differing values.

Characteristic curves

(measured with HLP46, $\vartheta_{oil} = 40 \pm 5^\circ\text{C}$)

Δp - q_v characteristic curve (B to A; lowest adjustable pressure differential)

Pilot flow dependent on the flow (B to A) and pressure differential

Notes:

- The characteristic curves apply to the pressure at the valve output $p = 0$ bar across the entire flow range.
- Valve body and hydraulic fluid temperature-compensated; large temperature differences may lead to differing values.

Characteristic curves(measured with HLP46, $\vartheta_{oil} = 40 \pm 5^\circ\text{C}$)**Notes:**

- The characteristic curves apply to the pressure at the valve output $p = 0$ bar across the entire flow range.
- Valve body and hydraulic fluid temperature-compensated; large temperature differences may lead to differing values.
